Pack together.
Deploy separately.

A three-piece dipole carrier for hike-in activations.

Two engaged posts. Separate coils. Short rear strap. CAD packing illustration.

LEFT + RIGHT. TWO POSTS.

A left and right winder join at both ends of the spine. The wire stays on opposite sides.

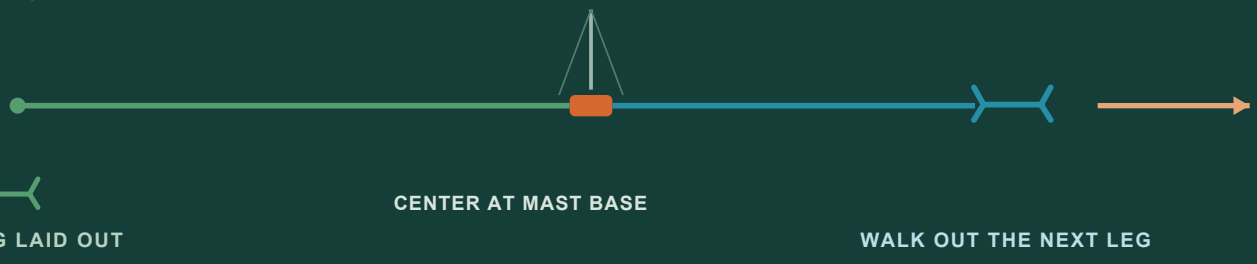

Slots in the center bar anchor a short rear strap that holds the three pieces together.

Why separate the winders?

A combined center and winder packs neatly, but paying out a leg can be awkward. Separate winders let you unwind as you walk. Nesting brings the three pieces back together when it is time to pack.

AT THE MAST

One leg at a time. Unwind as you walk.

Unstrap, lift apart, and walk out each leg. Then hoist the center.

WIND. NEST. STRAP. GO.

Rewind each leg, engage both posts, add the center and fasten the rear strap.
