Walk it out.
Pack it together.

A dipole center and two winders that travel as one.

THE IDEA

Three pieces. One bundle.

Each leg gets its own winder. Clip both winders to the center for packing.

CURRENT CAD MODEL

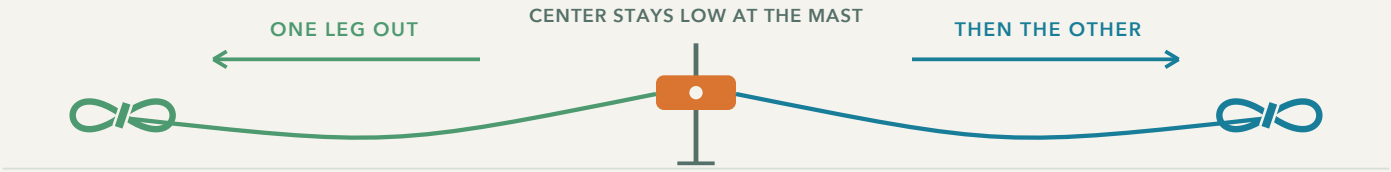

Wire coils omitted

WHY SPLIT THE WINDERS?

With a shared center/winder, a whole leg can end up in loose coils before you place it. Separate winders let you unwind as you walk, but leave three loose pieces to pack. Clip them together for the hike.

HOW IT WORKS

Deployment schematic

01 Release

Support the bundle. Pinch and lift each end of the center in turn. Keep the coil ties closed.

02 Walk it out

Secure the center low. Open one tie and unwind as you walk that leg out. Repeat, then hoist.

03 Pack it down

Wind from each tip toward the center in a figure eight. Tie each coil, then pinch each end to reattach the center.

Prototype design. Revised retention, loaded fit and field handling await testing.
